NOTES

MICROBIOLOGY

- a The cultural characteristics of this organism prohibit routine susceptibility testing.
Antimicrobials of choice: Erythromycin, fluoroquinolones, Tetracycline and Chloramphenicol. (Giguere et al; Antimicrobial Therapy in Veterinary Medicine, 5th edition, 2013). There is insufficient evidence to recommend the use of cephalexin or cefovecin for treatment of infection with Campylobacter spp.

Note: Generic antibiotics quoted. The choice of antibiotic and knowledge of any contraindications is the Veterinary Surgeons responsibility.
Organism identified by MALDI-TOF.

PARASITOLOGY

- b If there is a discrepancy between microscopy and ELISA, the patient is still considered to be infected with the parasite. The difference is due to different methods and sample sizes.
c Parasites: Zinc sulphate flotation with centrifugation.
